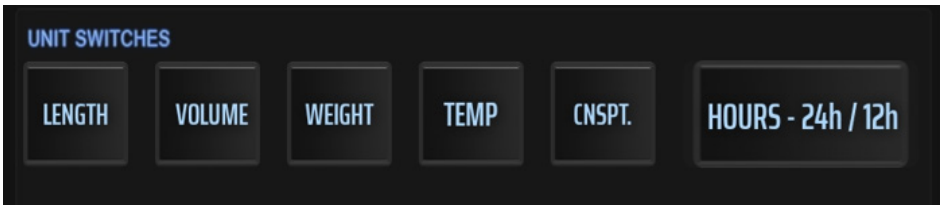
English

Installation of the page:
1. version 4.1.0 (or higher) of the plguin is required and TP V 4.3 (or higher)
2. delete previous page versions and import the current page with all values, sounds etc.
   if TP asks about previous vlaues replace them (replace previous value)

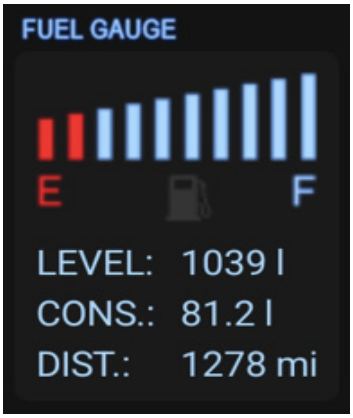
Use of the page
In order for the page to work properly, the key bindings in the game must be adapted to my plugin, or vice versa.
Some values only change when you are in the game and the value in the game also changes (e.g. odometer). Most values are queried as soon as one minute of in-game time has passed or the speed of the truck is at least 1. Therefore, some values may only become available after a short time at the start.

The following values can also be tapped in Touch Portal (smartphone / tablet) to query the current value:
Page 1: Odometer, Estimated journey time, estimated distance, next rest stop, remaining job time, destination, fuel gauge
Page 2: Source city, destination city, source company, destination company, remaining job time

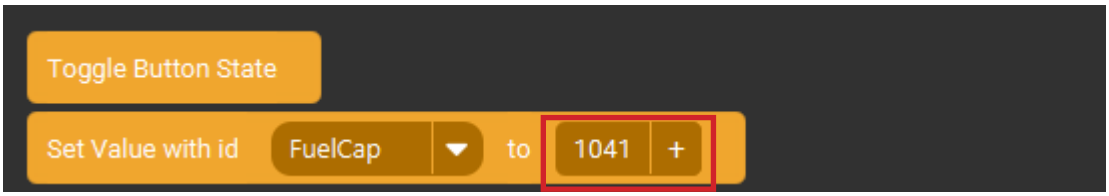
Set units
Please set all units on page 2 under „unit switches“ as set in the game. Simply press the corresponding button and the unit will be changed.
The plugin can handle liters as well as UK gallons and US gallons. Please set the corresponding unit under „volume“. And then set the corresponding unit again under „consumption“.



Fuel gauge
The fuel gauge shows the fuel level of the tank, as a bar and as a number (LEVEL). It also shows the average consumption (CONS - depending on the units set) and the estimated distance until the tank is empty (DIST).



An entry must be made here for the fuel gauge to work correctly. It can happen that if you install a different size fuel tank for a truck than the standard one, the game does not output the correct value for the maximum fuel level to the plugin. This is a bug in the game that has not yet been fixed. Therefore, please edit the button (the fuel gauge) in touch portal (on PC) and enter the current maximum fuel level (in liters, US gallons or UK gallons depending on the setting) in line 2 (Set Value with id Fuelcap to value) under „on pressed“, and then click on “Save & Close” at the bottom.



If a value of 0 is entered there, the button takes the value specified by the game. Then tap the fuel gauge on the smartphone / tablet once. The value for the current session is now saved. If Touch Portal is restarted, the units are changed or the truck is changed in between, please repeat this procedure if the entered Value changes. If the value does not chjange its sufficient to tap the button again. When changing units, remember to enter the maximum fuel level in the new unit.

Cruise control automatic:
There is a “cruise control automatic” button onthe left side. As soon as this button is activated, the set speed of the cruise control is automatically adjusted to the maximum permitted speed while the cruise control is active. When using this function, the automatic should be switched on first and then the cruise control should be activated. If the maximum speed changes while cruise control is active, the truck will automatically adjust the set cruise control speed to the new maximum permitted speed. Please set the cruise control grid step to 5 kmh/mph or less in the game options to be able to use this function. A step size of 5 is optimal for ATS and mph.

Speedometer
The speedometer displays a speed warning when you exceed the maximum speed limit by 5 km/h or 3 mph, indicated by a red warning triangle in the speedometer. An acoustic warning tone also sounds. This can be configured as follows. Edit the speedometer button and enter 0, 1, or 2 under On Pressed - Set Value with ID Speedviolationsetting. Now save the button and then tap the button once on the tablet/smartphone. If Touchportal is restarted, tap the button again so that the set number is applied again. 0 means no acoustic warning. 1 means a single warning tone when the maximum speed limit is exceeded. 2 means a permanent warning tone when the maximum speed limit has been exceeded.

Automatic refueling
This button holds down the key that is assigned in the game under “Keys and buttons” under “Activate” until the truck is fully fueled. (Please assign the same button in the game as in the plugin)
If you press the button at the gas station, it changes to ON. As soon as the maximum tank volume is reached, the key will be automatically released and the button changes to OFF. To end refueling beforehand, press the button again so that it changes to OFF.

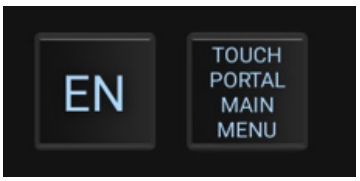
Windshield wiper, gear shift, motor brake
Two buttons are assigned to the windshield wiper in the game: wipers back (Numpad /) and wipers (P)

Two buttons are also assigned to the engine brake level: engine brake increase (Numpad+) and engine brake decrease (Numpad -)

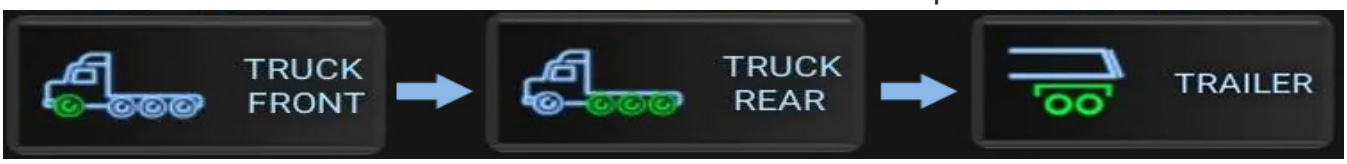
3 buttons are assigned in the game for the automatic gearshift: Shift to Drive (CTRL + D), Shift to Neutral (CTRL + N) and Shift to Reverse (CTRL + R)

Button page 1 / page 2
If the “Page 2” button does not work, please click on the button in the Touch Portal on the PC and refer to my 2nd page under “Go to page” under On Pressed. Proceed in the same way with the “Page 1” button.

Change language
On page 2 there is a button to change the language. It is set to EN by default.



Suspension
There are now suspension settings for the front and rear of the truck as well as for the trailer.
Use the SUSPENSION SELECT button to switch between the 3 options.



Use the 2 buttons below to raise or lower the suspension.

You can reset the suspension with this button.
